PROJECT SCOPE STATEMENT

Project Name	TeaStir

Project Deliverables	**Detailed Description**
Tea Recommendation System	TeaStir is a web-based application that is built upon a recommendation algorithm for finding the users their perfect cup of tea. When signing up for an account, TeaStir will ask the users for a **short survey** to get an idea of customers' preferences. TeaStir will then utilize these inputs to perform a recommendation algorithm. Based on the results of the algorithm, TeaStir will give the user a list of some of the hottest teas on the market that catered perfectly to the user's needs, wants, and desires.
User Rating System	Users can **evaluate** the recommendation result that they get from using our website. They can upvote/downvote their experience and therefore the development team (us) will know how our recommendation system performs.

Project Exclusions

[Indicate anything that will not be included in the scope of the project.]

1. TeaStir will not sell any products directly on its website, whereas, when the user gets their recommendation for their perfect cup of tea, there will be a clickable link which will take them to a retailer's website (such as DAVIDsTEA)and that is the place where they can actually buy tea.
2. TeaStir will not have an overly complicated built-in social system. TeaStir is a small project which focuses on its core function: tea recommendation. Users will have their unique user profile and will be able to share this website or their

experiences using it on social media, but, TeaStir will not imply any heavy communication functions such as an internal forum, etc.
